

# Getting Started with R

Enrico Toffalini

PSICOSTAT

# Why becoming an R user?

- **Mainstream in academia** for data science, increasingly used in business. *Job market advantage!*
- **Free & open-source:** wherever you go, R will be with you at no costs (unlike *MPLUS, MATLAB, SPSS*, etc.)
- **Real programming language:** difficult at the beginning, but: 1) gives you lots of flexibility; 2) has transfer on other programming languages (e.g., *Python*).
- **Vast community support** thanks to a large and active community (also, *chatGPT, Lucrez-IA*, etc., know it pretty well!).
- **Huge ecosystem**, >20,000 packages on CRAN, more from other sources (e.g., GitHub), to do amazing stuff with statistical data analysis, machine learning, data visualization, developing webapps [*shiny*], writing reports and even entire books [*bookdown, rmarkdown*]), can integrate with *quarto, github*.
- Facilitates **reproducible research** by sharing code and workflows.

# What you may expect to learn in this course:

- Executing fundamental operations and using basic functions;
- Working with essential data types and structures;
- Gaining some proficiency in managing and manipulating data with vectors and dataframes;
- Understanding some fundamental concepts of programming.

**Over the next *couple of years*, following this PhD program, you may have the opportunity to learn to use R to perform at least some fundamentals about:**

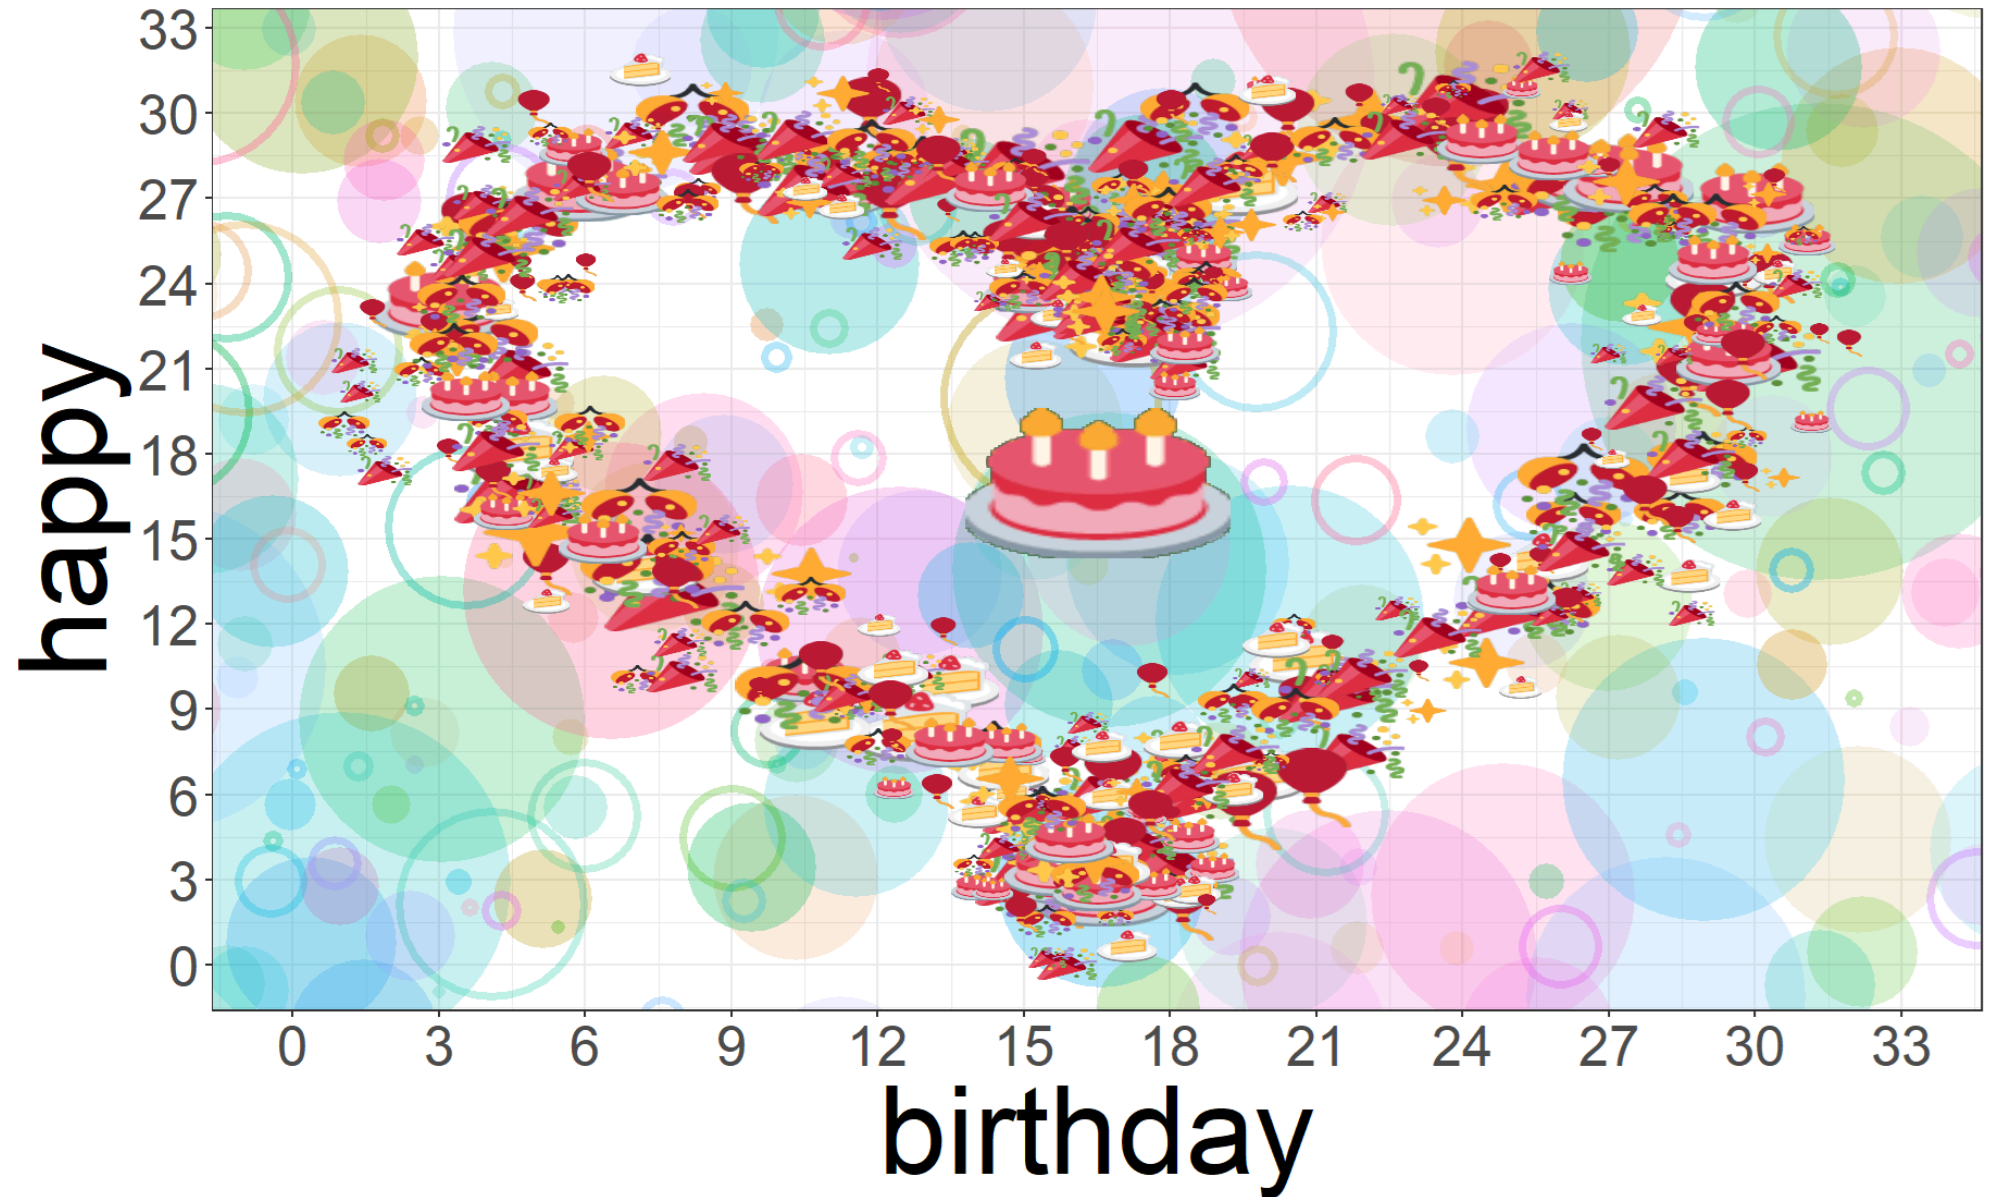

- Core statistical inference methods;
- (Generalized) linear (mixed-effects) modeling;
- Data visualization using *ggplot2*;
- Power analysis via data simulation ;
- Structural Equation Modeling (SEM);
- Conducting Meta-Analysis.

you may even create greeting cards

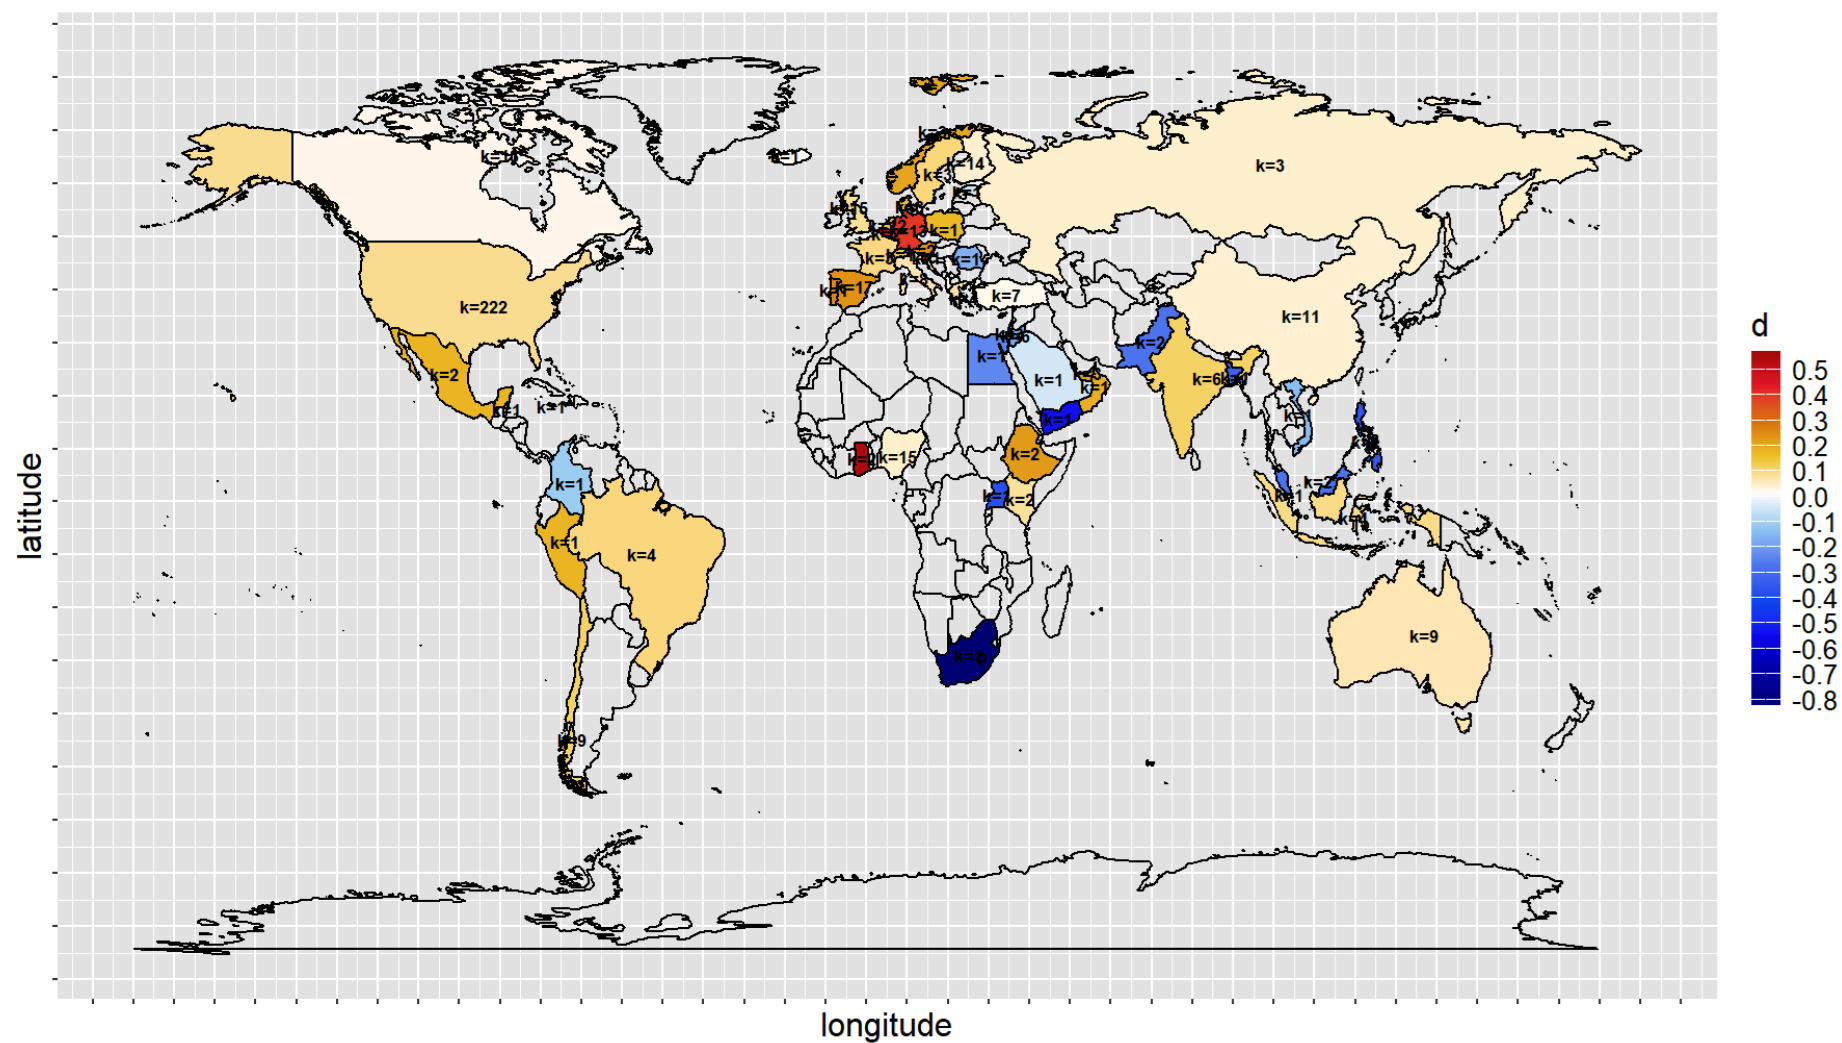

you may even create greeting cards

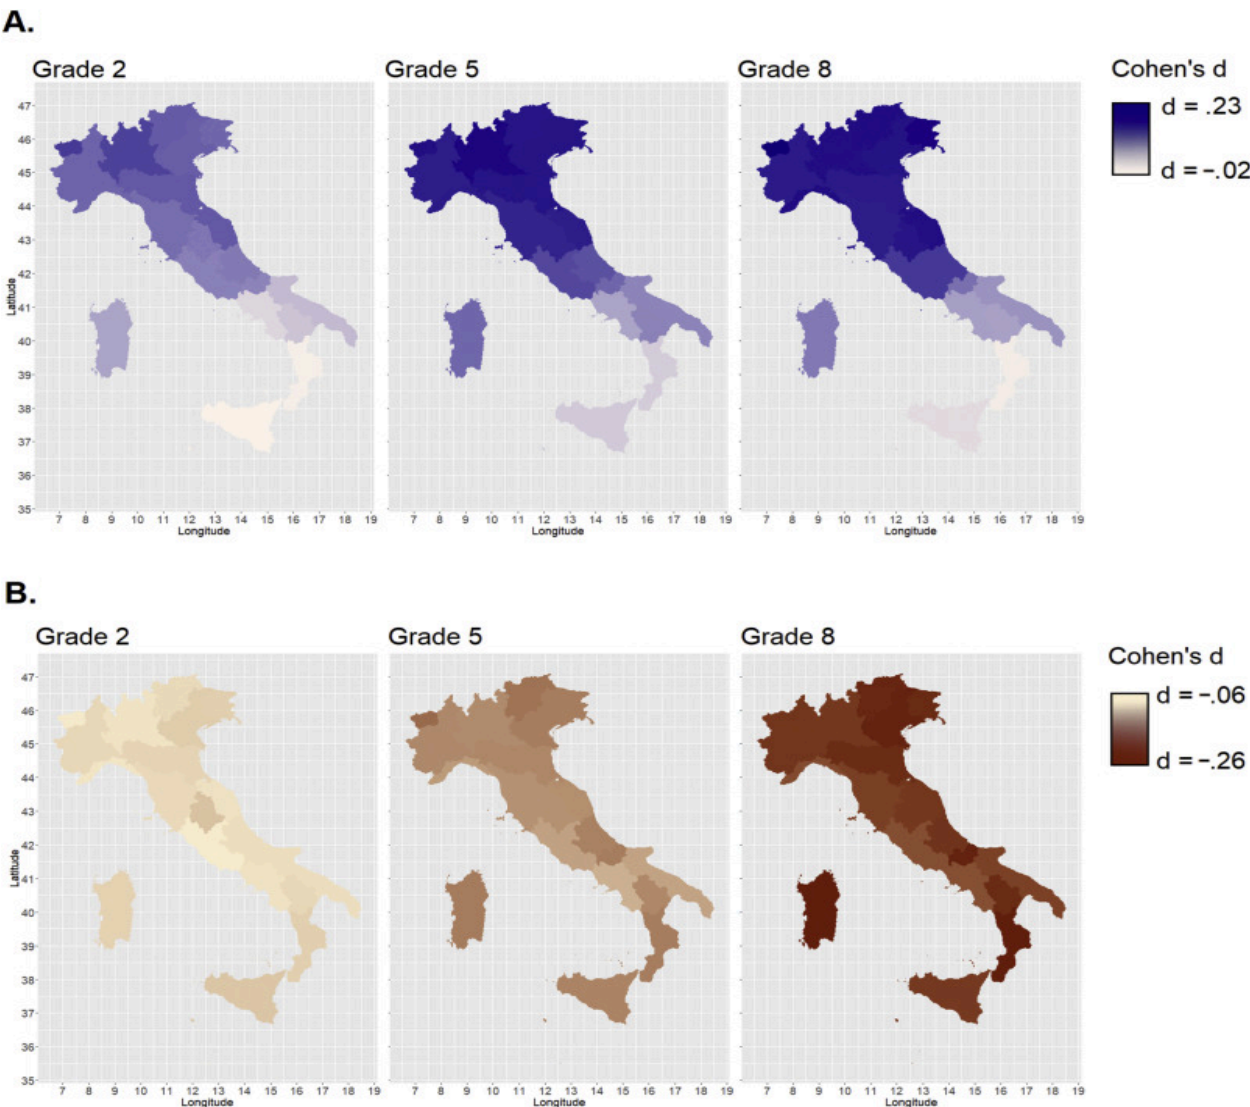

or like fancy infographics

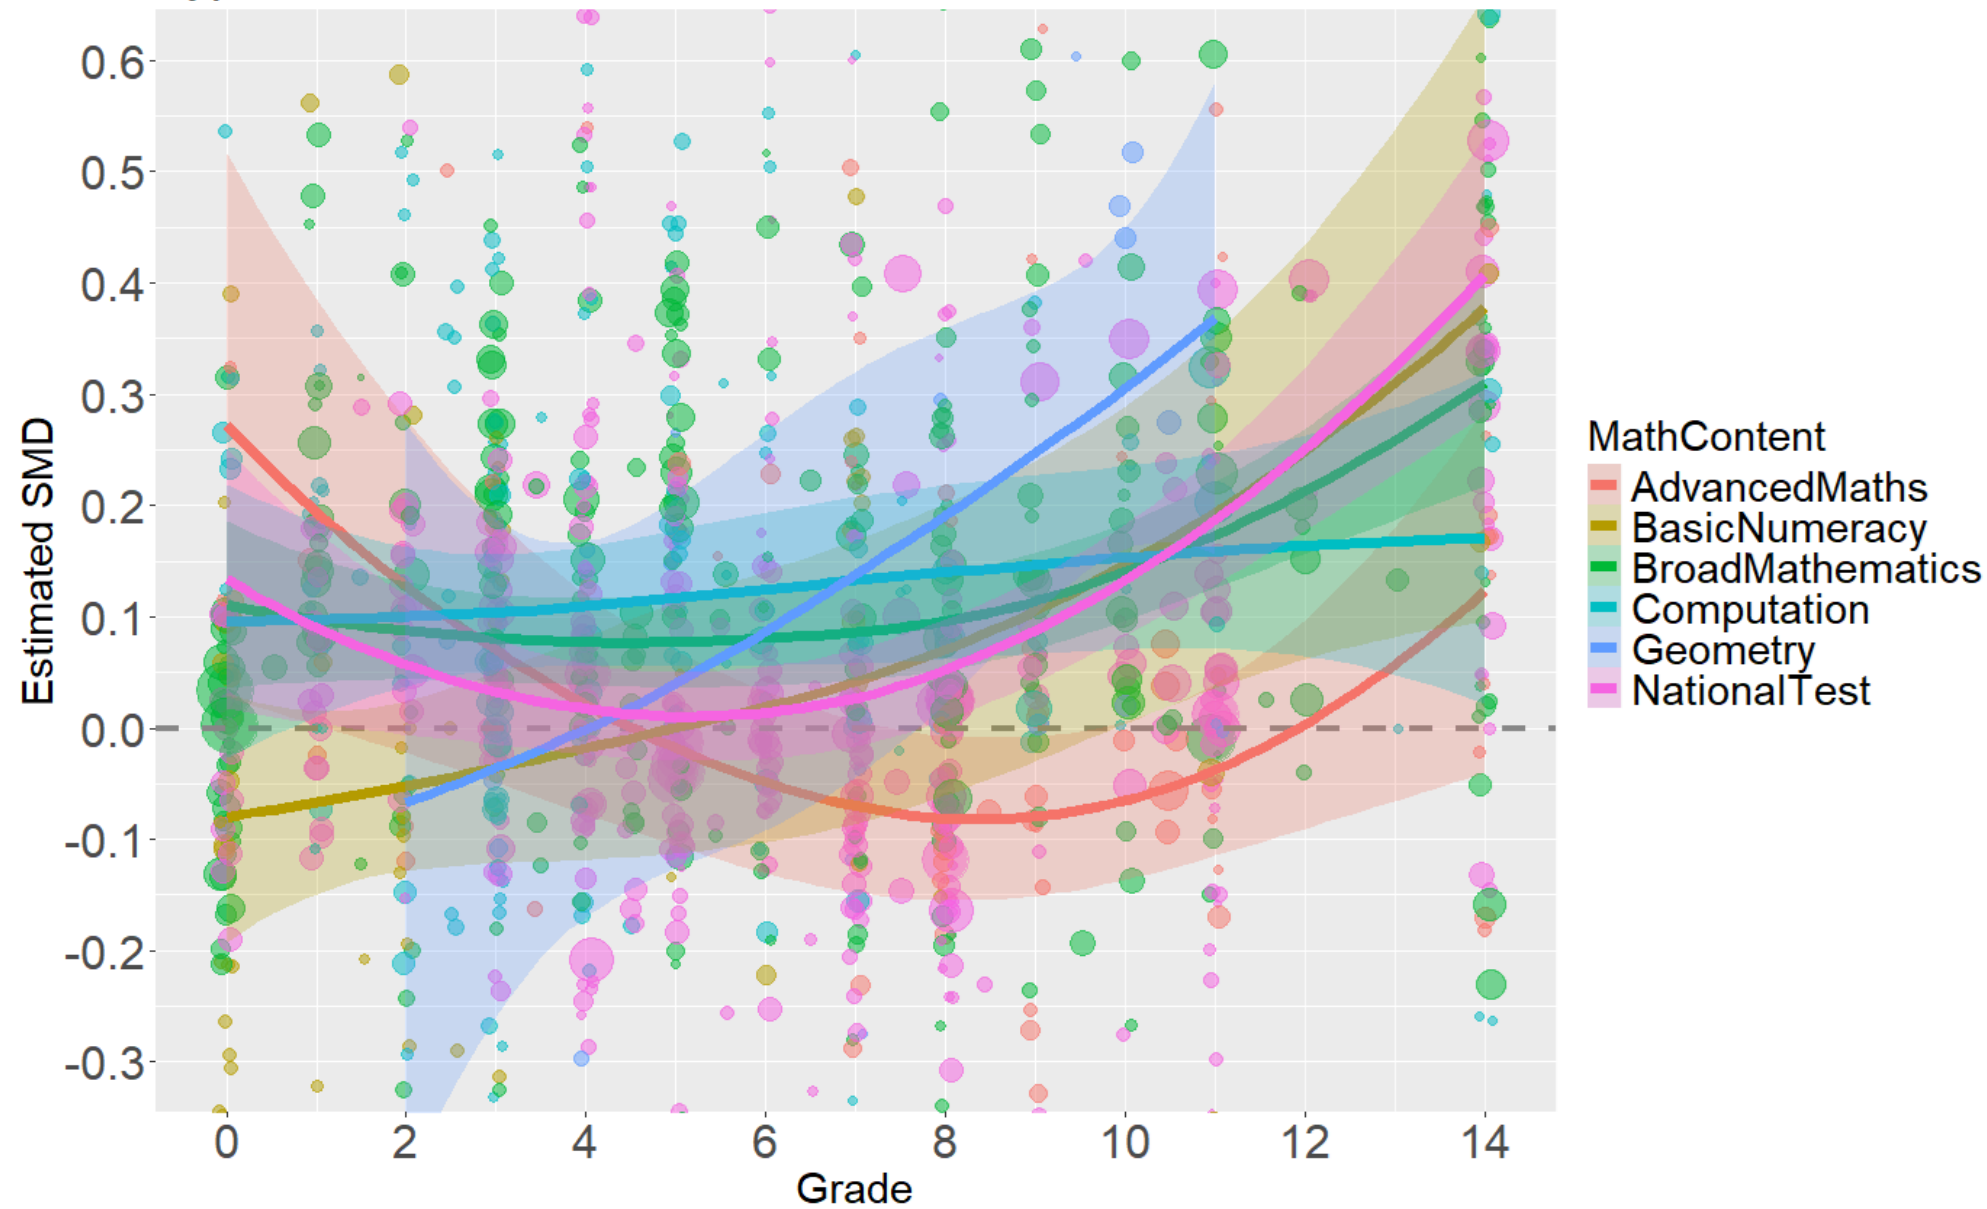

# or like fancy infographics

**perform classical data analysis**

Type of content x Grade interaction

# you may create interactive webapps with Shiny

see [Shiny gallery](#)

here's a couple of recent real examples from **Psicostat** members:

- this [game-like shiny app](#) developed for the science4all event in Padova; see [here](#) some explanation in Italian
- practical [ad-hoc shiny app](#) for scoring experimental data collected by students

# you may create interactive webapps with Shiny

# or entire websites and books

- this **entire course** is a website in its own right
- the **course textbook** is a book/website
- also see **this wonderful book** by Daniël Lakens explaining Statistical Inference

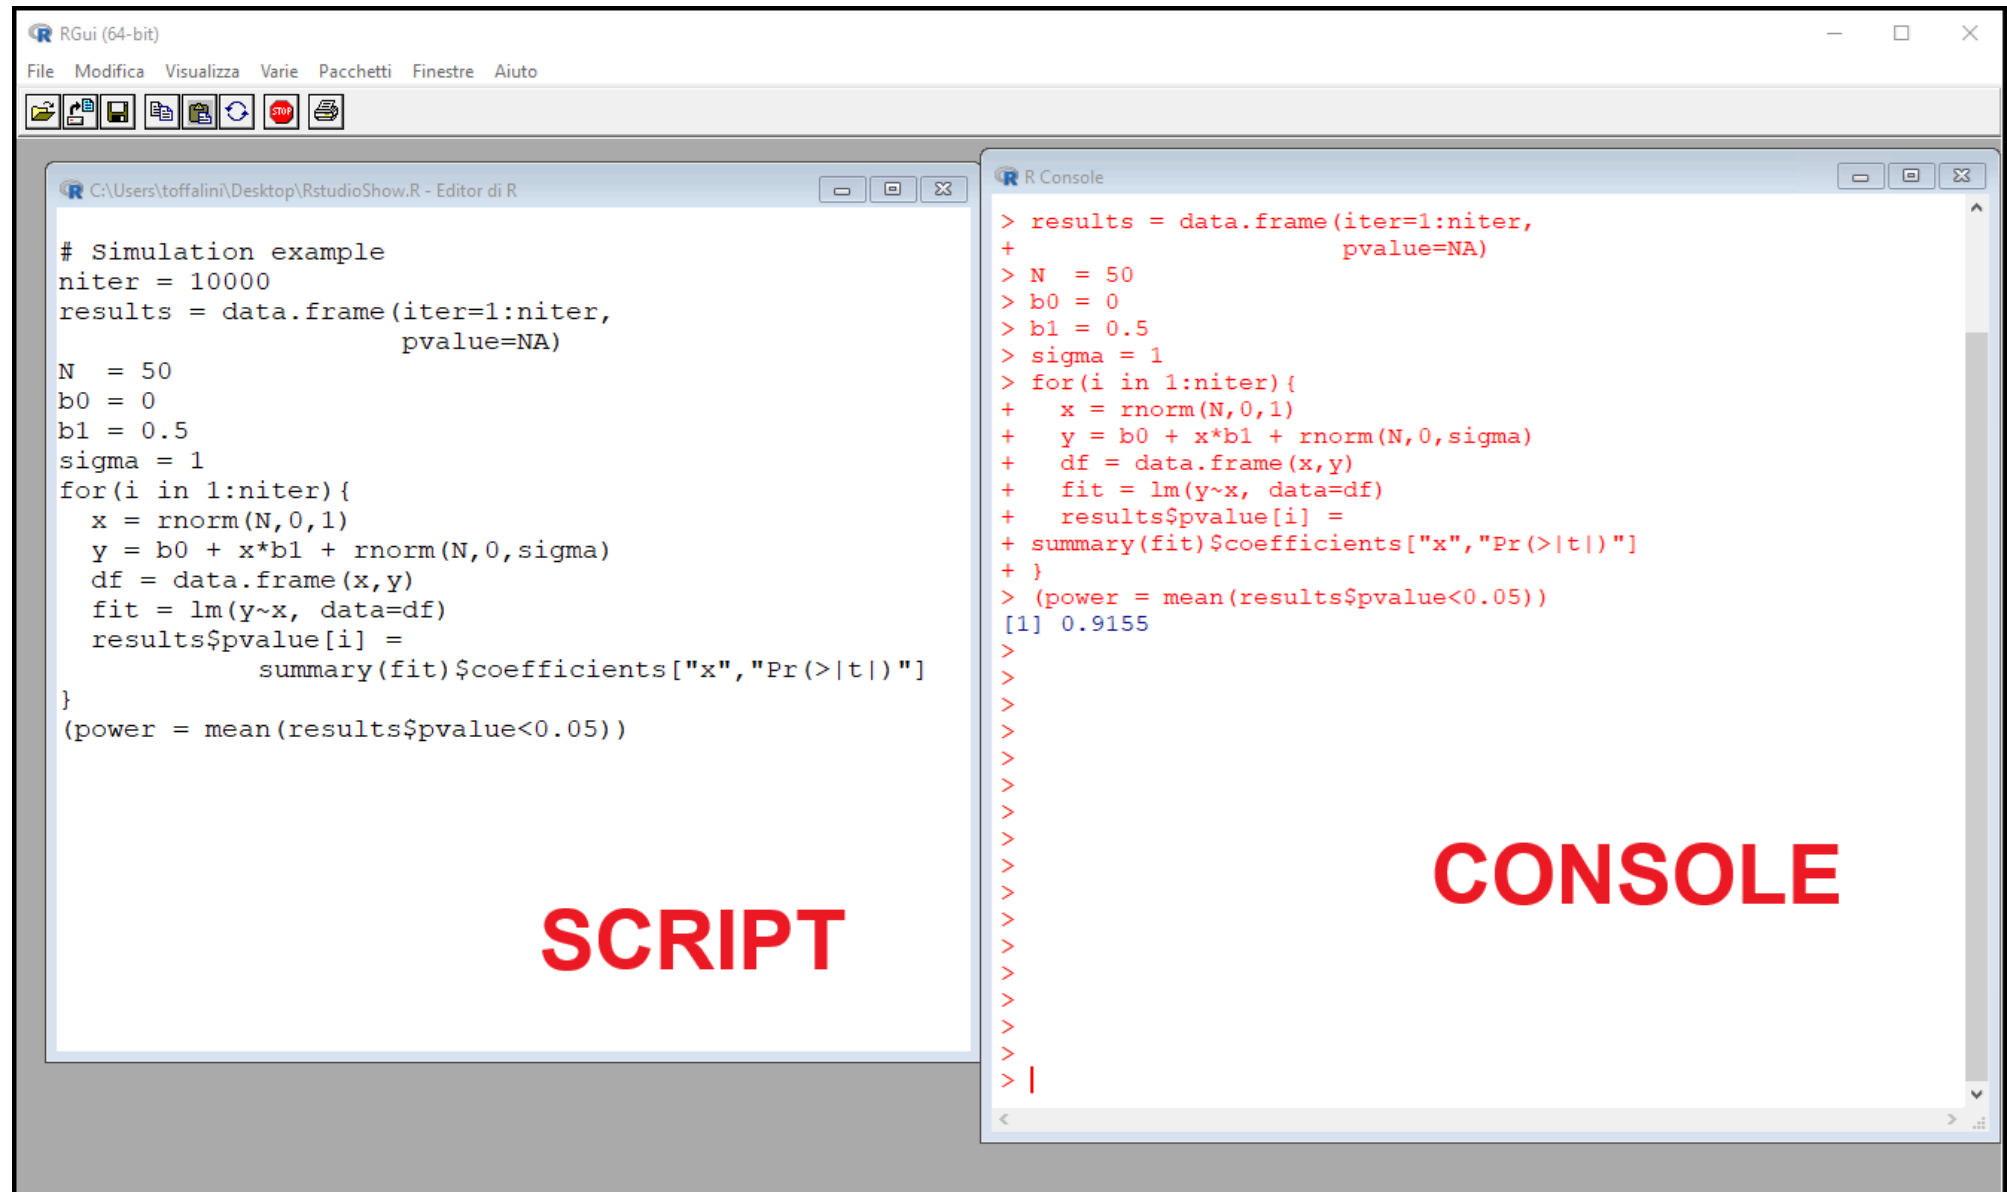

of course, these resources integrate other tools such as GitHub and Quarto, but they can be created within the R ecosystem

# install R and Rstudio

first of all, for getting started, follow the instructions in *Chapter 1* of *Introduction2R* to ensure that both R and RStudio are installed

# R Console (just base R)

# R Studio (full IDE)

The screenshot displays the R Studio IDE interface with four main panes:

- SCRIPT**: The top-left pane shows R code for a simulation example. The code defines parameters (N=50, b0=0, b1=0.5, sigma=1, niter=10000) and performs a linear regression simulation using a for loop. The final output is the power of the test, calculated as the mean of p-values less than 0.05.
- CONSOLE**: The top-right pane shows the execution of the R code. It displays the results of the simulation, including the power value (0.9105) and the p-value (0.918).
- ENVIRONMENT**: The bottom-left pane shows the current environment. It lists the objects created during the execution: df (50 obs. of 2 variables), fit (List of 12), results (10000 obs. of 2 variables), b0 (0), b1 (0.5), i (10000L), N (50), niter (10000), power (0.9105), and results (1).
- FILE EXPLORER, ETC.**: The bottom-right pane shows the file explorer. It displays the current directory structure and the files in the directory, including faviconpsicostat2.png (79.8 KB), psicostatLogo.png (264 KB), and RstudioShow.R (378 B).

The R Studio interface includes a menu bar at the top with options: File, Edit, Code, View, Plots, Session, Build, Debug, Profile, Tools, Help. The status bar at the bottom shows the current file (R Script) and the time (17:08, 31/10/2024).

## Some R packages that you will or may need in the future (1/3)

Package	Used for what	Example(s) of functions
<code>base</code> (base R)	Basic functions	<code>sum</code> , <code>mean</code> , <code>sqrt</code> , <code>abs</code> , <code>c</code> , <code>data.frame</code> , <code>summary</code> , <code>scale</code> , <code>plot</code> , <code>+</code> , <code>-</code>
<code>stats</code> (base R)	Basic statistical calculations and functions	<code>sd</code> , <code>cor</code> , <code>cor.test</code> , <code>t.test</code> , <code>lm</code> , <code>glm</code> , <code>AIC</code> , <code>rnorm</code> , <code>rbinom</code>
<code>graphics</code> (base R)	Basic statistical calculations and functions	<code>boxplot</code> , <code>hist</code> , <code>barplot</code>
<code>effectsize</code>	Compute different effect sizes	<code>cohens_d</code> , <code>hedges_g</code> , <code>cohens_f</code> , <code>d_to_r</code>

## Some R packages that you will or may need in the future (2/3)

Package	Used for what	Example(s) of functions
<code>lme4</code>	Fitting (generalized) (non-)linear mixed-effects models	<code>lmer</code> , <code>glmer</code> , <code>ranef</code>
<code>performance</code>	Useful tools for models	<code>check_collinearity</code> , <code>r2_nagelkerke</code> , <code>icc</code>
<code>effects</code>	Display effects for various statistical models	<code>allEffects</code>
<code>emmeans</code>	Estimate marginal means for various models	<code>emmeans</code>
<code>ggplot2</code>	Create beautiful plots using The Grammar of Graphics	<code>ggplot</code> , <code>geom_*</code>

## Some R packages that you will or may need in the future (3/3)

Package	Used for what	Example(s) of functions
<code>lavaan</code>	Structural equation modeling (SEM)	<code>cfa</code> , <code>sem</code>
<code>semTools</code>	Useful tools for SEMs	<code>reliability</code>
<code>metafor</code>	Perform meta-analysis	<code>rma</code> , <code>rma.mv</code> , <code>forest</code> , <code>funnel</code> , <code>regtest</code>
<code>brms</code>	Fitting practically any Bayesian model via MCMC with STAN	<code>brm</code> , <code>prior</code>
<code>blavaan</code>	Fitting Bayesian SEMs	<code>bcfa</code> , <code>bsem</code>

# Let's Test the Environment!

Let's run a few commands in RStudio to familiarize with its console and see if the installation works properly

```
rnorm(10) # draw 10 random values from a Standard Normal distribution
```

```
[1]  0.80615400 -0.58547491  1.10525657 -0.40379478 -0.98313925  0.06539615  
[7]  0.81912540  1.60196277  2.44925450 -0.44644926
```

```
?rnorm # open the help tab for the "rnorm" function
```

```
round( rnorm(10, mean=100, sd=15) ) # draw 10 values from IQ distribution
```

```
[1]  92 103 140  99  86  86  99  73  97  83
```

```
install.packages("psych") # install a package from CRAN
```

```
library(psych) # load the newly installed package
```

```
fisherz(rho=0.9) # use it to transform a correlation into a Fisher's z
```

```
[1] 1.472219
```
